Education

Virginia Tech, Ph.D. in Computer Engineering — GPA: 4.0/4.0 — *Sep 2021 – May 2027 (Expected)*

- Advisor: Prof. Yang (Cindy) Yi | BRICCS@VT (Brain-Inspired Computing, Communication, and Security Lab)
- Research: FPGA accelerators and on-chip learning for **Echo State Networks (reservoir computing)** in Next-G wireless systems

University of Southern California, Master of Engineering — GPA: 3.95/4.0 — *Sep 2019 – May 2021*

- Focus: Computer Architecture, VLSI Design, Digital System Design

Technical Skills

Hardware: Verilog/SystemVerilog RTL, DSP48 datapaths, systolic arrays, fixed-point design; Xilinx Virtex-7, Zynq-7000, Zynq UltraScale+, RFSoC (ZCU216)

Systems: 10G/1G Ethernet (MAC, PCS/PMA), UDP/IP (lwIP), AXI, PS–PL co-design; USRP SDRs, GNU Radio, Keysight PROPSIM

Tools: Vivado, Vitis, Quartus, Cadence, ns-3; Python, MATLAB, C

Research Experience

Graduate Research Assistant, BRICCS@VT, Virginia Tech — *Sep 2021 – Present*

Real-Time PC–FPGA Testbeds for Distributed MIMO Channel Prediction — *Feb 2026 – Jul 2026*

- Built two end-to-end testbeds that close a live 4×2 DMIMO loop (4-antenna gNB, two 2-antenna UEs, USRP N310/X310, Keysight PROPSIM F16): a 1 GbE PS–PL hybrid (lwIP UDP/IP on the ARM) and a 10 GbE pure-RTL design with the Ethernet MAC/PHY and one windowed-ESN predictor per UE in programmable logic.
- $\leq$**0.9 ms end-to-end latency** and **1,250 predictions/s per UE** at 3.42 W; NMSE 0.0119 (outdated CSI) $\rightarrow$ 0.0087 in live operation.

FPGA-based ESN with On-chip RLS Learning for MIMO Channel Prediction — *IEEE TCAD 2026* — *Apr 2024 – Dec 2024*

- Architected the first complete on-chip ESN with recursive-least-squares training on FPGA: a DSP48 systolic-array readout and an inversion-free, three-stage pipelined RLS engine whose latency grows only linearly with the state size.
- **3.87 μs per training + inference step**, 264 Mb/s at 1.2 W: $>$**1600**$\times$ / **290**$\times$ **the energy efficiency** of CPU / GPU, and 5.3$\times$ lower NMSE than the prior on-chip FPGA learner.

High-Speed Reservoir Neuron and HW/SW Co-design — *ICNC 2026* — *Jun 2024 – Sep 2025*

- Designed a hybrid DSP–CLB neuron (nine DSPs + carry-save adder tree) and a range-addressable tanh LUT: **+25% DSP efficiency**, 13% shorter processing time, 25% less tanh memory; the full ESN runs at **65.98 MS/s** and beats AR prediction by 5.7–14.2 dB in NMSE.
- Ported the ESN to a Zynq-7000 SoC with PL-based inference and PS-based learning.

ESN Symbol Detection for (Massive) MIMO-OFDM on FPGA — *ICCAD 2023, Frontiers 2024* — *Jun 2022 – Dec 2023*

- Designed a nine-DSP48 reservoir neuron and built an SDR/FPGA platform (USRP, GNU Radio, Virtex-7) for over-the-air 2×2 MIMO-OFDM detection: **3.3**$\times$ **the throughput** of the prior SISO accelerator, hardware BER within 0.03% of software and below MMSE in every scenario.
- Extended the detector to massive MIMO, outperforming LMMSE from 2×2 up to 4×64 antennas with only 8–16 reservoir neurons.

Optimized Reservoir Node Architecture for FPGA-based RC — *ISQED 2022* — *Oct 2021 – Feb 2022*

- Bit-serial, CSD-encoded neuron that hard-wires the fixed sparse weights: **80.7% fewer LUTs** and DSPs cut from 162 to 16 versus a DSP-based ESN.

Other Projects

Low-Power 10T-SRAM for In-Memory Computing (USC) — *Oct 2020 – Dec 2020*

- 64×64 10T-SRAM array with two asymmetric sense amplifiers for in-memory NOR/NAND; leakage cut with high-Vt devices, sizing, stacking and negative Vgs.

Dynamically Secured Scan Chain and Scan-based Attack (USC) *DFT 2021* *Aug 2020 – Nov 2020*

- Python netlist-to-Verilog flow with dynamic encryption logic and ModelSim verification of the attack model; contributed to GF-Flush (500-bit keys in $<$7 s, $>$4300$\times$ faster than SAT attacks).
